Vitamin B Complex & Choline Injection for Horses

High Level
Performance Horses

Improve Liver
Function

ACTIVE INGREDIENTS per mL:

Choline Chloride 5mg, Thiamine (Vitamin B1) 50mg, Riboflavin (Vitamin B2) 2mg, Pyridoxine (Vitamin B6) 10mg, Niacin 50mg & D-Panthenol 20mg

FEATURES & BENEFITS

- Provides the spectrum of B-group vitamins indicated for hard working horses engaged in racing and rigorous training/performance regimens being fed high grain rations.
- Improves energy metabolism to ensure the efficient release of energy necessary for optimal muscle function.
- Promotes red blood cell formation and regeneration. A less than optimal production of red blood cells may lead to a lowered oxygen carrying capacity of the blood, resulting in insufficient muscle perfusion.
- Provides a highly concentrated source of B-group vitamins which are not readily stored in the body and are necessary for energy conversion and provision.
- The addition of choline has favourable effects such as preventing fatty infiltration of the liver, assisting the elimination of toxins from the body (via the liver) and assisting nerve responses to aid healing.

DOSAGE RATES:

5mL/500kg every second day or as directed by a veterinarian.
Administration via intramuscular (IM) injection.

PACK SIZE(S):
50mL multi-dose vial
